

SILAQ

ECOFEED

**SILAQ is an microbial additive
facilitating the process
of silage preparation.**

It can be used to product silage from:

grasses

maize (whole plants and grains)

other plants

SILAQ

ECOFEED

SILAQ facilitates the fermentation process, even in bad environmental conditions. Product is based on 2 groups of bacteria:

- The homofermentative strains - quickly reduce the pH of ensiled material and stabilize the silage in just a few weeks
- The heterofermentative strain additionally produces acetic acid having a negative effect on fungi and yeasts.

Benefits of using SILAQ inoculant in silage production:

Ensure proper fermentation processes

Help in development of desirable bacteria cultures

Help farmers to product silage of the highest quality

Silage produced with SILAQ does not heat up during summer time, the feed is willingly eaten by animals and spoilage is minimized.

Form of preparation: Water-soluble powder.

A solution prepared in one package is sufficient for ensiling 50 t of raw material.

Composition: The bacterial composite contains in 1g 1×10^{11} CFU. Lactic acid bacteria: *Pediococcus acidilactici* CNCMI 3237, *Lactobacillus plantarum* CNCMI 3235, *Lactobacillus brevis* DSM 21982
Carrier: saccharose and lactose.
